PHOTOMETRIC AND RADIOMETRIC PROBES WITH OUTPUT SIGNAL IN
mV OR NORMALIZED 4...20 mA OR 0...10 Vdc OR RS485 MODBUS-RTU
OUTPUT**

Photo-radiometric probes with output signal in mV or standard output 4...20 mA or 0...10 Vdc or RS485 MODBUS-RTU output.

The probes of the series **LP...03 for outdoor use** allow to measure photometric and radiometric quantities such as: illuminance (lux), irradiance (W/m²) in the near ultraviolet spectral region UVA, UVB, and the photon flow across the PAR region (400 nm...700 nm).

The probes with mV output do not require any power supply. The output signal is obtained from a resistance that short-circuits the terminal of the photodiode. The ratio of generated photocurrent to incident light power is converted into a Difference of Potential that can be read by a voltmeter. Once the DDP (Difference of Potential) is known, the measured value can be calculated through the calibration factor.

All probes are individually calibrated and the calibration factor is also shown on the probe housing.

The probes with normalized output current 4...20 mA or voltage 0...10 Vdc or RS485 MODBUS RTU output require external power supply. The probe LPUVB03 is available only with standard output voltage 0...5 Vdc and requires external power supply.

All probes of the series LP...03 are equipped with diffuser for cosine correction, protection dome and M12 male 4-pole or 8-pole connector.

2, 5 or 10 m length cables with female connectors available on request.

LPPHOT03

The probe LPPHOT03 measures **illuminance (lux)**, defined as the ratio between the luminous flux (lumen) passing through a surface and the surface area (m²). The spectral response curve of a photometric probe is similar to the human eye curve, known as standard photopic curve V(λ). The difference in spectral response between LPPHOT03 and the standard photopic curve V(λ) is calculated by means of the error f₁. Calibration is carried out by comparison with a reference luxmeter, calibrated by a Primary Metrological Laboratory. The Calibration Procedure complies with the CEI publication No.69 "Methods of characterizing illuminance meters and luminance meters: Performance characteristics and specifications, 1987". The photometric measurement probe is designed for outdoor readings. CIE photopic filter. Output, according to the chosen configuration, in mV or 4...20 mA or 0...10 Vdc normalized output or RS485 MODBUS-RTU output.

LPPAR03

The probe **LPPAR03** measures the ratio between the number of photons that strike a surface in one second, in the 400 nm...700 nm spectral range and the surface area (m²).

This quantity is defined as **PAR: Photo-synthetically Active Radiation**.

The probe calibration is carried out by using an halogen lamp, with a known spectral irradiance in a specific spectral range. Temperature slightly affects the probe spectral response.

LPUVB03BLAV

The LPUVB03BLAV probe measures **global irradiance** (W/m^2) on a surface area (m^2) in the UVB (280 nm...315 nm) spectral region.

In particular, the spectral sensitivity is focused at 305 nm, with a bandwidth (FWHM) of 5 nm. The global irradiance is the result of the sum of direct solar irradiance and of diffused irradiance incident on a planar surface. In the UVB spectral region, unlike in the visible portion where the direct component prevails over the direct component, the light is strongly diffused by the atmosphere and thus the two components are equivalent, therefore is very important that the instrument is capable of measuring accurately both the components. The probe is designed for outdoor readings.
